TECHNOLOGY AG

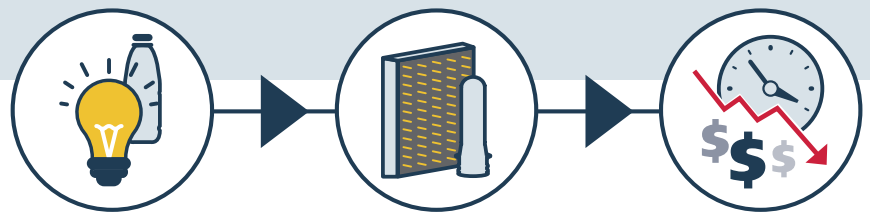

MHT-Prototyping

For more Efficiency in your Product Development

Our Contribution to Product Development

We know the importance of quality and time, when it comes to developing new products. That is why we would like to offer you our professional support.

Prototyping

As soon as the idea for your new bottle design has matured, we will create a preform sample in a very short time.

Based on your requirements and CAD data, we will plan the design implementation. Within two to three weeks, we create molding components and preform samples. If required, we can also blow-mold sample bottles for you in cooperation with a competent partner.

Saving Time and Money

Our fast two-cavity sampling concept will speed up your product development process. The quickly produced prototype preforms make it possible to gain important information, revealing improvement opportunities for future processes.

Using the simulation, the development time can be shortened dramatically, while increasing product development efficiency.

Last but not least, you will gain important information for optimizing the intended line production with our production tools.

If you want to learn more about our prototyping solutions or talk to us in person, please don't hesitate to contact us:
